;    30        0030  1 ! FUNCTIONAL DESCRIPTION:
;    31        0031  1 !       Does TRACEback when a program causes an exception of
;    32        0032  1 !       sufficiently high severity level and the exception
;    33        0033  1 !       is not fielded by anyone else (namely by itself of
;    34        0034  1 !       by DEBUG).
;    35        0035  1 !
;    36        0036  1 ! Version:      1.01
;    37        0037  1 !
;    38        0038  1 ! History:
;    39        0039  1 !       Author:
;    40        0040  1 !               Carol Peters, 11 January 1978 : Version 01
;    41        0041  1 !
;    42        0042  1 !       Modified by:
;    43        0043  1 !               Dale Roedger, 15 June 1978: Version 17
;    44        0044  1 !               Victoria Holt, 21 December 1982
;    45        0045  1 !
;    46        0046  1 ! Revision history:
;    47        0047  1 !
;    48        0048  1 !       02      17-jan-78       KGP     -Changed call parameters, and
;    49        0049  1 !                                        added code to do the traceback
;    50        0050  1 !                                        in non-symbolic form.
;    51        0051  1 !       03      18-jan-78       KGP     -Exception name is printed using
;    52        0052  1 !                                        system message formatter
;    53        0053  1 !       04      19-JAN-78       KGP     -Output is now properly formatted.
;    54        0054  1 !       05      26-jan-78       KGP     -Now TRACEBACK does not $EXIT
;    55        0055  1 !                                        under any circumstances.  This is
;    56        0056  1 !                                        so that we can SS$_RESIGNAL
;    57        0057  1 !                                        the original exception so that someone
```

```
;    58          0058  1 !                                                 else (the 'catch-all' handler) has
;    59          0059  1 !                                                 to ultimately decide what to do
;    60          0060  1 !                                                 about it.
;    61          0061  1 !       06      22-feb-78       KGP       -Output is to SYS$..., not DBG$...
;    62          0062  1 !                                                 We put out a separate message for
;    63          0063  1 !                                                 "traceback follows...".
;    64          0064  1 !       07      24-feb-78       KGP       -We always return the exception name
;    65          0065  1 !                                                 now so that the EXIT/CONTINUE
;    66          0066  1 !                                                 decision is made elsewhere.
;    67          0067  1 !                                         -Some diddling to make the severity
;    68          0068  1 !                                                 level of the TRACEBACK message the
;    69          0069  1 !                                                 same as the level of the exception.
;    70          0070  1 !       08      24-feb-78       KGP       -Formal parameter is now signal array
;    71          0071  1 !                                                 address rather than exception name
;    72          0072  1 !                                                 so we can PUT_MESSAGE rather than
;    73          0073  1 !                                                 doing all that ourselves.
;    74          0074  1 !       09      28-feb-78       KGP       -Changed all error returns in TRACE
;    75          0075  1 !                                                 to be EXITs.  Now, if TRACE returns
;    76          0076  1 !                                                 at all to the assembly-language TRACE
;    77          0077  1 !                                                 code, all must have gone well.
;    78          0078  1 !                                         -Added code to ensure that we don't
;    79          0079  1 !                                                 try to 'trace' an overwritten stack.
;    80          0080  1 !                                         -We don't re-map the symbol table
;    81          0081  1 !                                                 on successive TRACEbacks.
;    82          0082  1 !                                         -We now set up our output based on how
;    83          0083  1 !                                                 PUTMSG did it since it looks after
;    84          0084  1 !                                                 [not]creating the SYS$OUTPUT/SYS$ERROR
;    85          0085  1 !                                                 files, etc.
;    86          0086  1 !       10      01-mar-78       KGP       -Took out all initialization of
;    87          0087  1 !                                                 FABs/RABs, and we now don't do OPEN or
;    88          0088  1 !                                                 CONNECT.  We let PUTMSG setup everything.
;    89          0089  1 !       11      2-mar-78        KGP       -Beginning exception_type for
;    90          0090  1 !                                                 FTN PC correlation is now decided
;    91          0091  1 !                                                 in BAS (is no longer local to DPC)
;    92          0092  1 !       12      7-mar-78        KGP       -Exception_type is always forced to

```
;  508     0775  1 ROUTINE IS_EXCEPTION( EXC_NAME ) =
;  509     0776  1
;  510     0777  1 !++
;  511     0778  1 ! Functional Description:
;  512     0779  1 !
;  513     0780  1 !       Given an exception name - the longword which encodes the
;  514     0781  1 !       type, etc, of an exception - deduce if this exception is
;  515     0782  1 !       the so-called FAULT_EXC type.  This is for the PC_TO_LINE
;  516     0783  1 !       translation - we have to know if the PC is on the instruction
;  517     0784  1 !       which caused the exception, or if it is on the next instruction.
;  518     0785  1 !
;  519     0786  1 !       The answer to the question is simply whether
;  520     0787  1 !       the given EXC_NAME is in our table of exceptions.  The only
;  521     0788  1 !       trickery is that this routine makes sure only to look at
;  522     0789  1 !       the part of the longword which encodes the error code - and
;  523     0790  1 !       not at the rest of it since that may change.
;  524     0791  1 !
;  525     0792  1 ! Formal Parameters:
;  526     0793  1 !
;  527     0794  1 !       EXC_NAME - the longword system-defined exception name.
;  528     0795  1 !
;  529     0796  1 ! Routine Value:
;  530     0797  1 !
;  531     0798  1 !       TRUE or FALSE.  See above.
